Does Dupilumab Sustain Oral Corticosteroid (OCS) Reduction in Patients With Corticosteroid-Dependent Asthma? (TRAVERSE Study)

**STUDY DESIGN**

Multicenter, single-arm, open-label extension study of patients who had been previously randomized (as part of VENTURE study) to receive dupilumab vs placebo for 24 weeks.

**RESULTS**

At **96 weeks**, OCS dose decreased by **↓89.3%** in *dupilumab/dupilumab* group and by **↓74.4%** in *placebo/dupilumab* group.

In the TRAVERSE study, dupilumab sustained the oral corticosteroid dose reduction seen in the shorter term study, VENTURE, for at least 96 weeks and also maintained low exacerbation rate and improved lung function.
