Is There an Association Between Baseline Heart Rate (HR) and Pulmonary Embolism (PE) Outcomes?

**STUDY DESIGN**
- Prospectively collected data from 44,331 patients with symptomatic non-hypotensive pulmonary embolism
- Examined the relationship between admission HR and risk of 30-day all-cause mortality and PE-related mortality

**RESULTS**
- 30-day all cause mortality for the entire cohort was **5.1%**
- 30-day PE-related mortality rate was **1.9%**

![Graph showing the relationship between heart rate and mortality](image_url)

Patients in the higher strata of HR levels had significantly higher rates of 30-day all-cause and PE-related death

There was a positive association between HR at presentation and all-cause, as well as PE-related mortality.
