

What Are the Current Rates and Trends in All-Cause and RA-ILD-Related Hospitalizations in Patients With RA-ILD?

STUDY DESIGN

- Retrospective observational study of 7,075 patients with rheumatoid arthritis-related interstitial lung disease (RA-ILD) between 2003 and 2022
- Primary outcomes:
 - All-cause hospitalization
 - RA-ILD-related hospitalization

RESULTS

All-Cause Hospitalizations
(per 100,000 people)

RA-ILD-Related Hospitalizations
(per 100,000 people)

- Between 2003 and 2022, admissions per 100,000 people:
 - Increased from 6.4 to 12.9 for all-cause hospitalizations
 - Increased from 2.6 to 3.5 for RA-ILD-related hospitalizations

The findings of this study indicate that all-cause and RA-ILD-related hospitalizations are increasing, and that in-hospital mortality has not changed over time but remains substantial.
